The presenter states no conflict of interest and has no financial relationship to disclose relevant to the content of this presentation.

OUTLINE

I. Introduction to “new” resources

II. Objectives of webinar

Describe significant changes relevant to pre-existing antimicrobial susceptibility breakpoints...

Describe significant changes relevant to antimicrobial susceptibility testing methodology...

Identify (new) organism/antimicrobial combinations for which susceptibility breakpoints now exist...

as outlined in the CLSI M100 ED30 document.

What's (really exciting and) New?

Understanding and Addressing CLSI Breakpoint Revisions: a Primer for Clinical Laboratories

Romney M. Humphries,^{a,b} April N. Abbott,^c Janet A. Hindler^d

^aAccelerate Diagnostics, Tucson, Arizona, USA

^bUniversity of Arizona, Department of Pathology, Tucson, Arizona, USA

^cDeaconess Medical Center, Evansville, Illinois, USA

^dLos Angeles County Department of Public Health, Los Angeles, California, USA

ABSTRACT The Clinical and Laboratory Standards Institute (CLSI) has revised several breakpoints since 2010 for bacteria that grow aerobically. In 2019, these revisions include changes to the ciprofloxacin and levofloxacin breakpoints for the *Enterobacteriaceae* and *Pseudomonas aeruginosa*, daptomycin breakpoints for *Enterococcus* spp., and ceftaroline breakpoints for *Staphylococcus aureus*. Implementation of the revisions is a challenge for all laboratories, as not all systems have FDA clearance for the revised (current) breakpoints, compounded by the need for laboratories to perform validation studies and to make updates to laboratory information system/electronic medical record builds in the setting of limited information technology infrastructure. This minireview describes the breakpoint revisions in the M100 supplement since 2010 and strategies for the laboratory on how to best adopt these in clinical testing.

KEYWORDS CLSI, FDA, antimicrobial susceptibility testing, breakpoints

WHEN NEEDED (per CLSI M23)?

Recognition of a new resistance mechanism

New PK/PD data indicate existing breakpoint too high/low

Recognition that antimicrobial dosage regimens used in widespread clinical practice differ substantially from dosage regimens used to establish previous breakpoints

Introduction of new formulations of antimicrobial agents, resulting in different PK characteristics

New data emerge to demonstrate the previous breakpoints were not optimal for common uses of antimicrobial agent

WHEN NEEDED (per CLSI M23) II?

New data demonstrate poor prediction of clinical response using previous breakpoints

Specific public health need not addressed previously

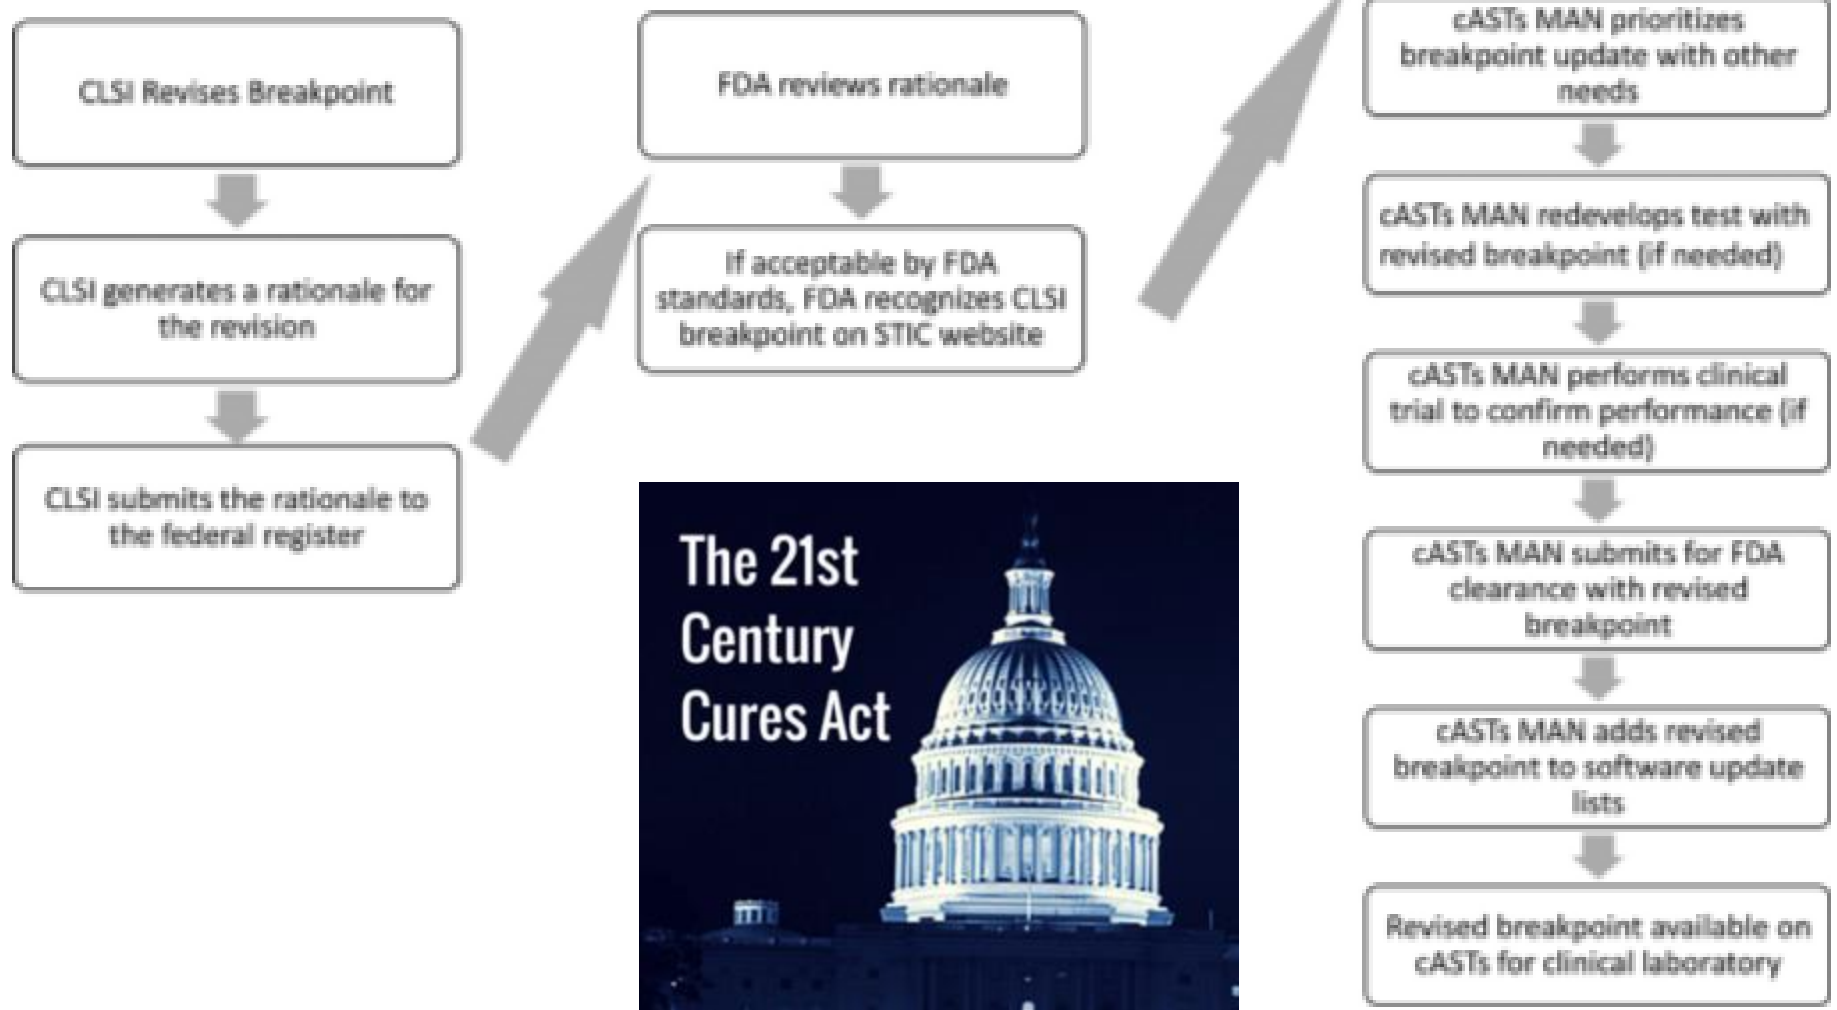

Significant MIC/disk diffusion discordance when testing recent clinical isolates

Changes to CLSI-approved reference methods

Revisions to simplify testing for specific resistance mechanisms

Differences between CLSI and other regulatory organizations

(MORE) IN SYNCH WITH FDA?

(MORE) IN SYNCH WITH FDA?

TABLE 4 cASTs with FDA clearance for current CLSI breakpoints^a

Organism group	Antimicrobial agent	BD phoenix	Beckman coulter MicroScan	bioMérieux Vitek 2	Thermo Fisher Sensititre
<i>Enterobacteriaceae</i>	Cefepime	Y	N	Y	Y
	Cefotaxime	N	Y	Y	Y
	Ceftriaxone	Y	Y	Y	Y
	Ceftazidime	N	N	N	N
	Ertapenem	Y	Y	Y	Y
	Imipenem	Y	Y	Y	Y
	Meropenem	Y	N	N	Y
<i>Enterobacteriaceae (Salmonella)</i>	Ciprofloxacin		<i>S. typhi</i>	<i>S. typhi</i> ; <i>S. enteritidis</i>	
<i>Pseudomonas aeruginosa</i>	Imipenem	Y	Y	Y	Y
	Meropenem	Y	Y	N	Y
	Piperacillin-tazobactam	Y	N	N	Y
<i>Acinetobacter</i> spp.	Imipenem	Y	Y	Y	Y

(LESS) IN SYNCH WITH FDA?

TABLE 5 Agents for which current CLSI breakpoints are not recognized by the FDA^a

Organism group	Antimicrobial agent
<i>Enterobacteriaceae</i>	Cefazolin Ciprofloxacin Levofloxacin
<i>Enterobacteriaceae (Salmonella)</i>	Levofloxacin
<i>Pseudomonas aeruginosa</i>	Cefepime ^b Ceftazidime ^b Ciprofloxacin Levofloxacin
<i>Acinetobacter</i> spp.	Meropenem
<i>S. aureus</i>	Ceftaroline
<i>Enterococcus</i> spp.	Daptomycin

PRIORITY 1 (implement now)

Enterobacteriaceae: carbapenem breakpoints

Enterobacteriaceae:
aztreonam
ceftriaxone
cefotaxime
ceftazidime
ceftizoxime
cefepime breakpoints

Salmonella spp.: fluoroquinolone breakpoints

P. aeruginosa

Acinetobacter spp.: carbapenem breakpoints

P. aeruginosa: piperacillin-tazobactam breakpoints

PRIORITY 2 (institutional need)

<i>Enterobacteriaceae:</i>	cefazolin breakpoints
<i>Enterobacteriaceae:</i>	fluoroquinolone breakpoints
<i>Pseudomonas aeruginosa:</i>	fluoroquinolone breakpoints
<i>Enterococcus spp.:</i>	daptomycin breakpoints

PRIORITY 3 (may need to implement)

<i>Pseudomonas aeruginosa:</i>	colistin breakpoints
<i>Staphylococcus aureus:</i>	ceftaroline breakpoints

Fluoroquinolone Breakpoints for *Enterobacteriaceae* and *Pseudomonas aeruginosa*

Michael Satlin, MD, MS
Audrey N. Schuetz, MD, MPH, D(ABMM)
Patricia J. Simner, PhD, D(ABMM)
Pranita D. Tamma, MD, MHS

HOW DOES THIS HAPPEN?

- CLSI voluntary consensus process
 - Members
 - Advisors
 - Observers (public)
- Subcommittee on antimicrobial susceptibility testing
 - In vitro* data
 - Pharmacokinetic/pharmacodynamic (PK/PD)
 - Clinical studies
- Establish AST methods, breakpoints (M100, M45), quality control ranges

WHY DID THIS ONE HAPPEN??

- Susceptibility may decrease over time, resulting in lack of clinical efficacy and/or safety
- Methods for analysis become more refined
- WRT fluoroquinolones, association with debilitating and potentially irreversible adverse reactions (tendinitis, tendon rupture, peripheral neuropathy, CNS effects)

FLASHBACK

Organism	Method	Ciprofloxacin Previous			Ciprofloxacin New		
		S	I	R	S	I	R
<i>Enterobacteriaceae</i>	BMD	≤ 1	2	≥ 4	≤ 0.25	0.5	≥ 1
<i>P. aeruginosa</i>	BMD	≤ 1	2	≥ 4	≤ 0.5	1	≥ 2

Organism	Method	Levofloxacin Previous			Levofloxacin New		
		S	I	R	S	I	R
<i>Enterobacteriaceae</i>	BMD	≤ 2	4	≥ 8	≤ 0.5	1	≥ 2
<i>P. aeruginosa</i>	BMD	≤ 2	4	≥ 8	≤ 1	2	≥ 4

1114 Wisconsin clinical
Escherichia coli isolates

THEORY

- In order for an antimicrobial agent to work:

Get there

Get there in enough concentration

Stay there long enough

- Area Under serum concentration Curve

Measures how high (concentration) and how long (time) antimicrobial levels remain above target MIC during a dosing interval

METHODS

- AUC:MIC ratios can be calculated (and can vary)
 - Fluoroquinolones vs. GP; AUC:MIC ≥ 30
 - Fluoroquinolones vs. GNR; AUC:MIC closer to 100
- Two pneumonia studies established clinical (free) AUC:MIC ratio target of 72 for *Enterobacteriaceae*

Table 9. Summary of Nonclinical and Clinical Free-Drug AUC:MIC Ratio Targets for Efficacy¹⁰
 (Reprinted with permission from USCAST, The National Antimicrobial Susceptibility Testing Committee for the United States. Quinolone In Vitro Susceptibility Test Interpretive Criteria Evaluations. Version 1.3, 2018. <http://www.uscast.org>.)

Organism	Nonclinical Free-Drug AUC:MIC Ratio Targets			Clinical Free-Drug AUC:MIC Ratio Targets
	Net Bacterial Stasis	1-log ₁₀ CFU Reduction From Baseline	2-log ₁₀ CFU Reduction From Baseline	
<i>Enterobacteriaceae</i>	35.6	67.4	140.0	72.0
<i>P. aeruginosa</i>	34.8	47.3	65.4	72.0

Abbreviations: AUC, area under the curve; CFU, colony-forming unit; MIC, minimal inhibitory concentration.

Table 10. Percent Probabilities of PK-PD Target Attainment by MIC Based on PK-PD Targets for *Enterobacteriaceae*¹⁰ (Reprinted with permission from USCAST, The National Antimicrobial Susceptibility Testing Committee for the United States. Quinolone In Vitro Susceptibility Test Interpretive Criteria Evaluations. Version 1.3, 2018. <http://www.uscast.org>.)

Antimicrobial Agent	Route of Administration	Dosing Regimen	Population	MIC, $\mu\text{g/mL}$	End Points for Nonclinical Free-Drug AUC:MIC Ratio Targets (Magnitude of Target)			Clinical Free-Drug AUC:MIC Ratio Target (72)
					Net Bacterial Stasis (35.6)	1- \log_{10} CFU Reduction From Baseline (67.4)	2- \log_{10} CFU Reduction From Baseline (140)	
Ciprofloxacin	PO	500 mg every 12 hours	Healthy subjects with inflated variance	0.03	100	100	100	100

Genome-based phylogeny and taxonomy of the 'Enterobacteriales': proposal for *Enterobacterales* ord. nov. divided into the families *Enterobacteriaceae*, *Erwiniaceae* fam. nov., *Pectobacteriaceae* fam. nov., *Yersiniaceae* fam. nov., *Hafniaceae* fam. nov., *Morganellaceae* fam. nov., and *Budviciaceae* fam. nov.

Enterobacteriaceae

Enterobacterales

Enterobacteriaceae

Erwiniaceae fam. nov.

Pectobacteriaceae fam. nov.

Yersiniaceae fam. nov.**

Hafniaceae fam. nov.**

Morganellaceae fam. nov.**

Budviciaceae fam. nov.

Table 2A. Zone Diameter and MIC Breakpoints for Enterobacterales

Testing Conditions

Medium: Disk diffusion: MHA
Broth dilution: CAMHB; **iron-depleted CAMHB for cefiderocol (see Appendix I)¹**
Agar dilution: MHA

Inoculum: Broth culture method or colony suspension, equivalent to a 0.5 McFarland standard

Incubation: 35°C ± 2°C; ambient air
Disk diffusion: 16–18 hours
Dilution methods: 16–20 hours

Routine QC Recommendations (see Tables 4A-1 and 5A-1 for acceptable QC ranges)

Escherichia coli ATCC[®] 25922
Pseudomonas aeruginosa ATCC[®] 27853 (for carbapenems)
***Staphylococcus aureus* ATCC[®] 25923 (for *Salmonella enterica* ser. Typhi azithromycin disk diffusion testing only; see Table 4A-1)**

Refer to Tables 4A-2 and 5A-2 to select strains for routine QC of β-lactam combination agents.

When a commercial test system is used for susceptibility testing, refer to the manufacturer's instructions for QC test recommendations and QC ranges.

OTHER NOMENCLATURE CHANGES

- *Salmonella* Typhi to *Salmonella enterica* ser. Typhi
Salmonella Paratyphi to
Salmonella enterica ser. Paratyphi
- Methicillin-resistant to methicillin (oxacillin)-resistant
- Intermediate ranges denoted with \wedge in Tables 2 are based on known ability of these agents to concentrate in urine; some can also concentrate in other anatomic sites (epithelial lining); β -lactams, FQ, AG

NON-*Enterobacterales* (TABLE 2B-5)

Pseudomonas spp., not *Pseudomonas aeruginosa*

Non-fastidious, non-glucose fermentative GNR except:

Acinetobacter spp.

Burkholderia cepacia complex

Stenotrophomonas maltophilia

Aeromonas hydrophila, *Burkholderia pseudomallei*,
Burkholderia mallei, *Vibrio* spp. (including *V. cholerae*)
can be found in CLSI M45

Instructions for Use of Tables

INSTRUCTIONS FOR USE I

- Susceptible-dose dependent definition modified:
“...also includes a buffer zone for inherent variability in test methods, which should prevent small, uncontrolled, technical factors from causing major discrepancies in interpretations, especially for drugs with narrow pharmacotoxicity margins.”
- Intermediate definition modified:
“...also includes a buffer zone for inherent variability in test methods.”

INSTRUCTIONS FOR USE II

Supplemental Tests (Optional)

Supplemental Test	Organisms	Test Description	Optional for:	Table Location
ESBL	<ul style="list-style-type: none"> • <i>E. coli</i> • <i>K. pneumoniae</i> • <i>Klebsiella oxytoca</i> • <i>Proteus mirabilis</i> 	Broth microdilution or disk diffusion clavulanate inhibition test for ESBLs	<p>Isolates demonstrating reduced susceptibility to cephalosporins</p> <p>Results that indicate presence or absence of ESBLs</p>	3A
CarbaNP	<ul style="list-style-type: none"> • Enterobacterales • <i>P. aeruginosa</i> 	Colorimetric assay for detecting carbapenem hydrolysis	<p>Isolates demonstrating reduced susceptibility to carbapenems</p> <p>Results that indicate presence or absence of certain carbapenemases</p>	3B, 3B-1

INSTRUCTIONS FOR USE III

Surrogate Agent Tests

Surrogate Agent	Organisms	Test Description	Results	Table Location
Cefazolin	<ul style="list-style-type: none"> • <i>E. coli</i> • <i>Klebsiella pneumoniae</i> • <i>P. mirabilis</i> 	Broth microdilution or disk diffusion	<p>When used for therapy of uncomplicated UTIs, predicts results for the following oral antimicrobial agents: cefaclor, cefdinir, cefpodoxime, cefprozil, cefuroxime, cephalexin, and loracarbef</p> <p>Cefazolin as a surrogate may overcall resistance to cefdinir, cefpodoxime, and cefuroxime. If cefazolin tests resistant, test these drugs individually if needed for therapy.</p>	1A, 2A
Cefoxitin	<ul style="list-style-type: none"> • <i>S. aureus</i> • <i>S. lugdunensis</i> • <i>S. epidermidis</i> • Other <i>Staphylococcus</i> spp. (excluding <i>S. pseudintermedius</i> and <i>S. schleiferi</i>) 	<p>Broth microdilution: <i>S. aureus</i> <i>S. lugdunensis</i></p> <p>Disk diffusion: <i>S. aureus</i> <i>S. lugdunensis</i> Other <i>Staphylococcus</i> spp., excluding <i>S. pseudintermedius</i> and <i>S. schleiferi</i></p>	Predicts results for <i>mecA</i> -mediated methicillin (oxacillin) resistance.	1A, 2C, 3F
Oxacillin	<ul style="list-style-type: none"> • <i>S. pneumoniae</i> 	Disk diffusion	Predicts penicillin susceptibility if oxacillin zone is ≥ 20 mm. If oxacillin zone is ≤ 19 mm, penicillin MIC must be done.	1B, 2G
Pefloxacin	<ul style="list-style-type: none"> • <i>Salmonella</i> spp. 	Disk diffusion	Predicts reduced susceptibility to ciprofloxacin	2A

Table 1

TABLE 1A

Table 1A. (Continued)

Group C: Includes alternative or supplemental antimicrobial agents that may require testing in institutions that harbor endemic or epidemic strains resistant to several of the primary drugs, for treatment of patients allergic to primary drugs, for treatment of unusual organisms, or for reporting to infection prevention as an epidemiological aid.			
Enterobacterales	<i>Pseudomonas aeruginosa</i>	<i>Staphylococcus</i> spp.	<i>Enterococcus</i> spp. ⁿ
Aztreonam		Chloramphenicol ^b	Gentamicin (high-level resistance testing only)
Ceftazidime		Ciprofloxacin or levofloxacin	Streptomycin (high-level resistance testing only)
Ceftaroline		Moxifloxacin	Dalbavancin ^{5,*}
Chloramphenicol ^{b,d}		Gentamicin ^m	Oritavancin ^{5,*}
Tetracycline ^a		Dalbavancin ^{1,*}	Telavancin ^{5,*}
		Oritavancin ^{1,*}	
		Telavancin ^{1,*}	
Group U: Includes antimicrobial agents that are used only or primarily for treating UTIs.			
Cefazolin (surrogate test for uncomplicated UTI) ^f		Nitrofurantoin	Ciprofloxacin
Fosfomycin ^f		Sulfisoxazole	Levofloxacin
Nitrofurantoin		Trimethoprim	Fosfomycin ^f
Sulfisoxazole			Nitrofurantoin
Trimethoprim			Tetracycline ^a
Group A: Includes antimicrobial agents considered appropriate for inclusion in a routine, primary testing panel, as well as for routine reporting of results for the specific organism group.			
<i>Acinetobacter</i> spp.	<i>Burkholderia cepacia</i> complex	<i>Stenotrophomonas maltophilia</i>	Other Non-Enterobacterales ^{9,*}
Ampicillin-sulbactam	Levofloxacin [*]	Levofloxacin	Ceftazidime
Ceftazidime	Meropenem	Minocycline	Gentamicin
Ciprofloxacin	Trimethoprim-sulfamethoxazole	Trimethoprim-sulfamethoxazole	Tobramycin
Levofloxacin			
Doripenem			
Imipenem			
Meropenem			
Gentamicin			
Tobramycin			

TABLE 1B

Table 1B. Suggested Groupings of Antimicrobial Agents Approved by the US Food and Drug Administration for Clinical Use That Should Be Considered for Testing and Reporting on Fastidious Organisms by Microbiology Laboratories in the United States

Group A: Includes antimicrobial agents considered appropriate for inclusion in a routine, primary testing panel, as well as for routine reporting of results for the specific organism group.

<i>Haemophilus influenzae</i> ^o and <i>Haemophilus parainfluenzae</i>	<i>Neisseria gonorrhoeae</i> ⁱ	<i>Streptococcus pneumoniae</i> ^k	<i>Streptococcus</i> spp. β-Hemolytic Group ^q	<i>Streptococcus</i> spp. Viridans Group ^q
Ampicillin ^{o,g}	Azithromycin [†]	Erythromycin ^{a,c}	Clindamycin ^{o,p}	Ampicillin ^{h,†} Penicillin ^{h,†}
	Ceftriaxone [†]			
	Cefixime [†]			
	Ciprofloxacin [†]	Penicillin ⁱ (oxacillin disk)	Erythromycin ^{a,c,p}	
Tetracycline ^{b,†}	Trimethoprim-sulfamethoxazole	Penicillin ^{o,†} or ampicillin ^{o,†}		

Group B: Includes antimicrobial agents that may warrant primary testing but may be reported only selectively, such as when the organism is resistant to agents of the same antimicrobial class, as in Group A.^d

p. **Rx:** Recommendations for intrapartum prophylaxis for group B streptococci are penicillin or ampicillin. Although cefazolin is recommended for penicillin-allergic women at low risk for anaphylaxis, those at high risk for anaphylaxis may receive clindamycin. Group B streptococci are susceptible to ampicillin, penicillin, and cefazolin, but may be resistant to erythromycin and clindamycin. When group B *Streptococcus* is isolated from a pregnant woman with severe penicillin allergy (high risk for anaphylaxis), erythromycin and clindamycin (including inducible clindamycin resistance [ICR]) should be tested, and only clindamycin should be reported. Erythromycin, even when tested for determination of ICR, should not be reported. See Table 3H.

Table 2

TABLE 2--CEFIDEROCOL

- Iron-depleted cation-adjusted MH broth for broth microdilution
- Test/report group “Investigational”

Organism	Disk Diffusion (30 µg)			Broth Microdilution		
	S	I	R	S	I	R
<i>Enterobacteriales</i>	≥ 16	12-15 ^	≤ 11	≤ 4	8 ^	≥ 16
<i>P. aeruginosa</i>	≥ 18	13-17 ^	≤ 12	≤ 4	8 ^	≥ 16
<i>Acinetobacter</i> spp.	≥ 15	11-14	≤ 10	≤ 4	8	≥ 16
<i>S. maltophilia</i>	≥ 17	13-16	≤ 12	≤ 4	8	≥ 16

TABLE 2--POLYMYXINS

- Broth microdilution methods; no disk diffusion
- Test/report group O

Includes antimicrobial agents that have a clinical indication for the organism group, but are generally not candidates for routine testing and reporting in the United States

Organism	Colistin			Polymyxin B		
	S	I	R	S	I	R
<i>Enterobacteriales</i>		≤ 2 ^	≥ 4		≤ 2	≥ 4
<i>P. aeruginosa</i>		≤ 2	≥ 4		≤ 2	≥ 4
<i>Acinetobacter</i> spp.		≤ 2	≥ 4		≤ 2	≥ 4

TABLE 2--POLYMYXINS

LIPOPEPTIDES

(36) **WARNING:** Clinical and PK-PD data demonstrate colistin and polymyxin B have limited clinical efficacy, even if an intermediate result is obtained. Alternative agents are strongly preferred. Colistin and polymyxin B should be used in combination with one or more active antimicrobial agents. Consultation with an infectious diseases specialist is recommended.

(37) Several species are intrinsically resistant to the lipopeptides (colistin and polymyxin B). Refer to Appendix B.

O	Colistin or polymyxin B		-	-	-	-	-	-	≤2 [^] ≤2	≥4 ≥4	<p>(38) Colistin (methanesulfonate) should be given with a loading dose and maximum renally adjusted doses (see International Consensus Guidelines^a).</p> <p>(39) Polymyxin B should be given with a loading dose and maximum recommended doses (see International Consensus Guidelines^a).</p> <p>(40) When colistin or polymyxin B is given systemically, neither is likely to be effective for pneumonia.</p> <p>(41) For colistin, broth microdilution, CBDE, and CAT MIC methods are acceptable. For polymyxin B, broth microdilution is the only approved method. Disk diffusion and gradient diffusion methods should not be performed (see Table 3D).</p>

AMINOGLYCOSIDES

TABLE 2 (and more)--NORFLOXACIN

- Reinstated norfloxacin disk diffusion and MIC breakpoints for testing and reporting urinary tract isolates
- Test/report group O

Organism	Disk Diffusion (10 µg)			Broth Microdilution		
	S	I	R	S	I	R
<i>Enterobacterales</i>	≥ 17	13-16	≤ 12	≤ 4	8	≥ 16
<i>P. aeruginosa</i>	≥ 17	13-16	≤ 12	≤ 4	8	≥ 16
Non- <i>Enterobacterales</i>				≤ 4	8	≥ 16
<i>Staphylococcus</i> spp.	≥ 17	13-16	≤ 12	≤ 4	8	≥ 16
<i>Enterococcus</i> spp.	≥ 17	13-16	≤ 12	≤ 4	8	≥ 16

TABLE 2C

Organism	Methods for Detection of Methicillin (Oxacillin)-Resistant <i>Staphylococcus</i> spp.				
	Cefoxitin MIC	Cefoxitin disk diffusion	Oxacillin MIC	Oxacillin disk diffusion	Oxacillin salt agar
<i>S. aureus</i>	Yes (16–20 h)	Yes (16–18 h)	Yes (24 h)	No	Yes (24 h)
<i>S. lugdunensis</i>	Yes (16–20 h)	Yes (16–18 h)	Yes (24 h)	No	No
<i>S. epidermidis</i>	No	Yes (16–18 h)	Yes (24 h)	Yes (16–18 h)	No
<i>S. pseudintermedius</i>	No	No	Yes (24 h)	Yes (16–18 h)	No
<i>S. schleiferi</i>	No	No	Yes (24 h)	Yes (16–18 h)	No
Other <i>Staphylococcus</i> spp. (not listed above)	No	Yes ^a (24 h)	Yes ^a (24 h)	No	No

Abbreviations: h, hour(s); MIC, minimal inhibitory concentration; MRS, methicillin (oxacillin)-resistant staphylococci; PBP2a, penicillin-binding protein 2a.

^a For isolates of “other *Staphylococcus* spp.” from serious infections for which the oxacillin MICs are 0.5–2 µg/mL, testing for *mecA* or PBP2a should be considered (see comment [17]). Cefoxitin disk diffusion is not currently recommended.

TABLE 3F SPOILER ALERT

Table 3F. Test for Detecting Methicillin (Oxacillin) Resistance in *Staphylococcus* spp.

Test	Detecting <i>mecA</i> -Mediated Resistance Using Cefoxitin		Detecting <i>mecA</i> -Mediated Resistance Using Oxacillin			Detecting <i>mecA</i> -mediated Resistance Using Oxacillin Salt Agar	
	Disk Diffusion		Broth Microdilution	Disk Diffusion	Broth Microdilution and Agar Dilution		Agar Dilution
Organism group	<i>S. aureus</i> and <i>S. lugdunensis</i>	Other <i>Staphylococcus</i> spp. (excluding <i>S. pseudintermedius</i> and <i>S. schleiferi</i>)	<i>S. aureus</i> and <i>S. lugdunensis</i>	<i>S. epidermidis</i> , <i>S. pseudintermedius</i> , and <i>S. schleiferi</i>	<i>S. aureus</i> and <i>S. lugdunensis</i>	<i>Staphylococcus</i> spp. (excluding <i>S. aureus</i> and <i>S. lugdunensis</i>)	<i>S. aureus</i>
Medium	MHA		CAMHB	MHA	CAMHB with 2% NaCl (broth microdilution) MHA with 2% NaCl (agar dilution)		MHA with 4% NaCl
Antimicrobial concentration	30 µg cefoxitin disk		4 µg/mL cefoxitin	1-µg oxacillin disk	2 µg/mL oxacillin	0.25 µg/mL oxacillin	6 µg/mL oxacillin
Inoculum	Standard disk diffusion procedure		Standard broth microdilution Procedure	Standard disk diffusion procedure	Standard broth microdilution procedure or standard agar dilution procedure		Colony suspension to obtain 0.5 McFarland turbidity Using a 1-µL loop that was dipped in the suspension, spot an area 10–15 mm in diameter. Alternatively, using a swab dipped in the suspension and the excess liquid expressed, spot a similar area or streak an entire quadrant.
Incubation conditions	33 to 35°C; ambient air ^a		33 to 35°C; ambient air ^a	33 to 35°C; ambient air ^a	33 to 35°C; ambient air ^a		33 to 35°C; ambient air ^a
Incubation length	16–18 hours	24 hours (may be reported after 18 hours, if resistant)	16–20 hours	16–18 hours	24 hours (may be reported after 18 hours, if resistant)		24 hours; read with transmitted light
Results	≤ 21 mm = <i>mecA</i> positive ≥ 22 mm = <i>mecA</i> negative	≤ 24 mm = <i>mecA</i> positive ≥ 25 mm = <i>mecA</i> negative	≥ 8 µg/mL = <i>mecA</i> positive ≤ 4 µg/mL = <i>mecA</i> negative	≤ 17 mm = <i>mecA</i> positive ≥ 18 mm = <i>mecA</i> negative	≥ 4 µg/mL = <i>mecA</i> positive ≤ 2 µg/mL = <i>mecA</i> negative	≥ 0.5 µg/mL = <i>mecA</i> positive ≤ 0.25 µg/mL = <i>mecA</i> negative	Examine carefully with transmitted light for > 1 colony or light film of growth. > 1 colony = oxacillin resistant

TABLE 2C

- Oxacillin MIC breakpoints may overcall resistance

Some isolates for which oxacillin MIC is 0.5-2.0 µg/mL may be *mecA*-negative

May test such isolates from serious infections for *mecA* or PBP2a

Negative results should be reported as oxacillin (methicillin) S

- Erythromycin R / clindamycin I or S

(30) Inducible clindamycin resistance can be detected by disk diffusion using the D-zone test or by broth microdilution (see Table 3G, Subchapter 3.9 in M02,¹ and Subchapter 3.12 in M07²).

See comment (26).

2019

(30) For isolates that test erythromycin resistant and clindamycin susceptible or intermediate, testing for ICR by disk diffusion using the D-zone test or by broth microdilution is required before reporting clindamycin (see Table 3H, Subchapter 3.9 in M02,¹ and Subchapter 3.12 in M07²).

2020

CLSI M100 ED30; 2020

TABLE 2D

susceptible-dose dependent 

LIPOPEPTIDES										
B	Daptomycin <i>E. faecium</i> only	-	-	-	-	-	≤ 4	-	≥ 8	(12) Daptomycin should not be reported for isolates from the respiratory tract. (13) The breakpoint for SDD is based on a dosage regimen of 8–12 mg/kg administered every 24 h and is intended for serious infections due to <i>E. faecium</i> . Consultation with an infectious diseases specialist is recommended.
B	Daptomycin <i>Enterococcus</i> spp. other than <i>E. faecium</i>	-	-	-	-	≤ 2	-	4	≥ 8	(14) The breakpoint for susceptible is based on a dosage regimen of 6 mg/kg administered every 24 h. See comment (12).

originally included in the March 2019 re-released version of M100, 29th ed.

TABLE 2G

Table 2G
Streptococcus pneumoniae
M02 and M07

Table 2G. Zone Diameter and MIC Breakpoints for *Streptococcus pneumoniae*

Testing Conditions	Routine QC Recommendations (see Tables 4B and 5B for acceptable QC ranges)
<p>Medium: Disk diffusion: MHA with 5% sheep blood or MH-F agar (MHA with 5% defibrinated horse blood and 20 µg/mL NAD) Broth dilution: CAMHB with LHB (2.5% to 5% v/v) (see M07¹ for instructions for preparation of LHB) Agar dilution: MHA with sheep blood (5% v/v); recent studies using the agar dilution method have not been performed and reviewed by the subcommittee.</p> <p>Inoculum: Colony suspension, equivalent to a 0.5 McFarland standard, prepared using colonies from an overnight (18- to 20-hour) sheep blood agar plate</p> <p>Incubation: 35°C ± 2°C Disk diffusion: 5% CO₂; 20–24 hours Dilution methods: ambient air; 20–24 hours (CO₂ if necessary, for growth with agar dilution)</p>	<p><i>S. pneumoniae</i> ATCC^{®a} 49619</p> <p>Disk diffusion: deterioration of oxacillin disk content is best assessed with <i>S. aureus</i> ATCC[®] 25923, with an acceptable range of 18–24 mm on unsupplemented MHA.</p> <p>When a commercial test system is used for susceptibility testing, refer to the manufacturer's instructions for QC test recommendations and QC ranges.</p>

(5) For disk diffusion, results using MHA with 5% sheep blood and MH-F agar were equivalent when disk contents, testing conditions, and zone diameter breakpoints in Table 2G were used. Disk diffusion QC ranges for *S. pneumoniae* ATCC[®] 49619 in Table 4B apply to testing using either MHA with 5% sheep blood or MH-F agar.

oral cefuroxime results may be interpreted for isolates other than those from CSF

CarbaNP TESTING (TABLE 3B)

CarbaNP TESTING (TABLE 3B)

- Test recommendations largely derived from testing US isolates of *Enterobacterales* and *P. aeruginosa* and provide >90% sensitivity and >90% specificity for detection of the following carbapenemases:

KPC
IMP

NDM
SPM

VIM
SME

- Ability of this test to detect OXA-48-like producers is poor

BRAND NEW TABLE (TABLE 3D)

- Colistin testing
 - broth microdilution
 - broth disk elution
 - agar dilution
- Polymyxin B testing
 - broth microdilution
- Colistin and polymyxin B are equivalent agents
 - Colistin MIC predict polymyxin MIC (vice versa)
 - CLSI has not evaluated polymyxin B methods *per se*
 - NO GO for *Acinetobacter* spp.

BRAND NEW TABLE (TABLE 3D)

Testing multi-drug-resistant isolates for clinical or infection prevention purposes

Parameter	Colistin Broth Disk Elution	Colistin Agar Test
Approved organisms	<i>Enterobacterales</i> <i>Pseudomonas aeruginosa</i>	<i>Enterobacterales</i> <i>Pseudomonas aeruginosa</i>
Strengths	No special reagents or media	Test up to 10 at once
Limitations	Hands-on time/cost	Requires special media** (colistin)
Medium	Cation-adjusted MHB (10-mL tubes)	Mueller Hinton Agar** (100 mm)
Antimicrobial	10- μ g colistin disks	Special prepared media**
Desired [colistin]	0 μ g/mL (growth control), 1 μ g/mL, 2 μ g/mL, 4 μ g/mL	
Inoculum	0.5 McFarland; 50 μ L delivery	0.5 McFarland; 1:10 dilution; streak
Incubation	33-35°C, ambient air; 16-20 hours

Appendices

NEW APPENDIX I

Appendix I. Cefiderocol Broth Preparation and Reading Broth Microdilution Minimal Inhibitory Concentration End Points

Abbreviations for Appendix I

CAMHB	cation-adjusted Mueller-Hinton broth
ID-CAMHB	iron-depleted cation-adjusted Mueller-Hinton broth
pH	negative logarithm of hydrogen ion concentration

I1. Supplements

I1.1 Calcium and Magnesium Stock Solutions

Refer to M07¹ for cation stock solution preparation.

I1.2 Zinc Stock Solution

The steps for preparing zinc stock solution are listed below.

Step	Action	Comment
1	Dissolve 0.29 g ZnSO ₄ · 7H ₂ O in 100 mL deionized water.	This solution contains 10 mg Zn ⁺⁺ /mL.
2	Sterilize the solution by membrane filtration.	
3	Store the solution at 15 to 25°C.	

I2. Iron-depleted Cation-adjusted Mueller-Hinton Broth

The steps for preparing iron-depleted cation-adjusted Mueller-Hinton broth (ID-CAMHB) are listed below.²

NEW APPENDIX I

Appendix I. (Continued)

Figure 1. Cefiderocol Test With a Clear End Point. The cefiderocol concentrations in wells G1 to G12 are 0.03 to 64 µg/mL. Row G shows the cefiderocol MIC at 0.5 µg/mL in well G5 (red circle). The growth-control well is H11 (black box). (Courtesy of Meredith M. Hackel, International Health Management Associates. Used with permission.)

Figure 2. Cefiderocol Test With a Trailing End Point. The cefiderocol concentrations in wells A1 to A12 are 0.03 to 64 µg/mL. Row A shows the cefiderocol MIC at 0.25 µg/mL in well A4 (red circle). The growth control well is B11 (black box). (Courtesy of Meredith M. Hackel, International Health Management Associates. Used with permission.)

“2020 AST Conference”

Tuesday April 7, 2020

AGENDA

- Keynote address
- Stewardship panel
- Review of automated systems, antibiograms
- Breakout sessions
- Free food

Thank you for your attention.
Have a good 2020.
